## Puzzle – "Escher Cubes"

Design by: Jean Claude Constantin (P2D-250) see at www.knobelbox.com

An extremely difficult puzzle with a total of 61 fields. 12 differently shaped pentominoes (five triangular base shapes) and the single triangular base element should completely fill the playing area.

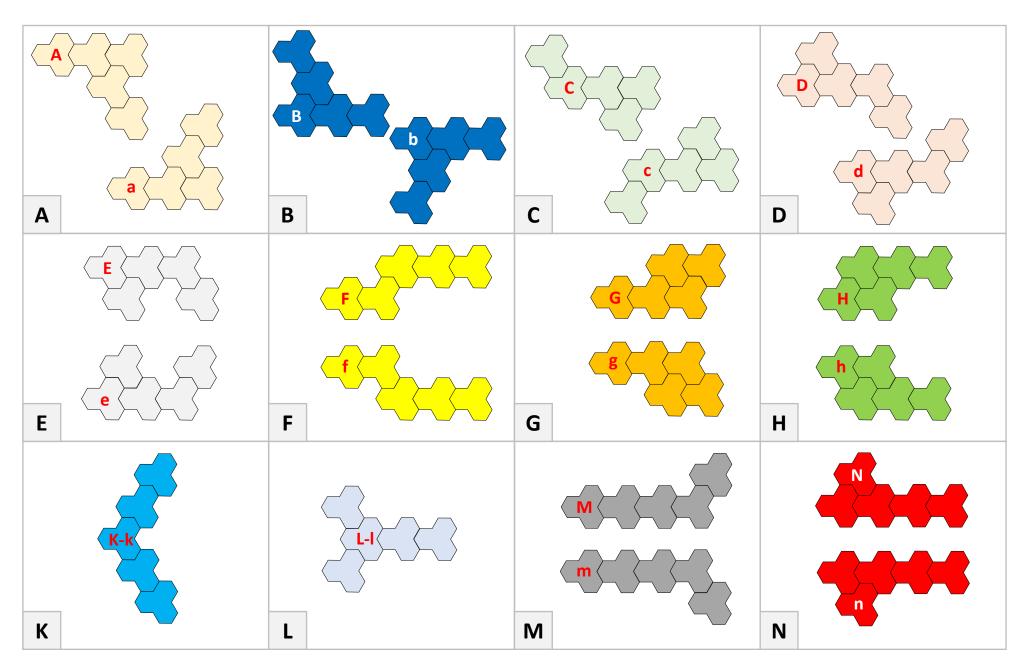

There are ten predefined positions for the base element. Solution #[2] and #[5] are derivatives of #5 >> #(5)

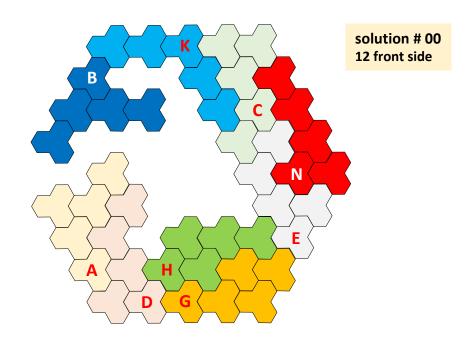

The puzzle has space for 21 solutions (marked in yellow). So far, 32 solutions have been found in 20 positions. Other positions can be reached by rotating it by 120 degrees. There is also the option of turning the entire playing field in space.

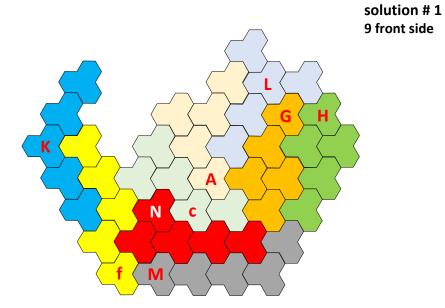

### Figures of front side (large letters) and back side (small letters)

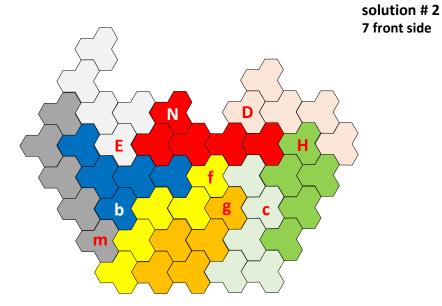

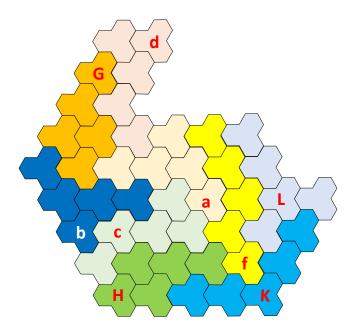

solution # 3 11 front side

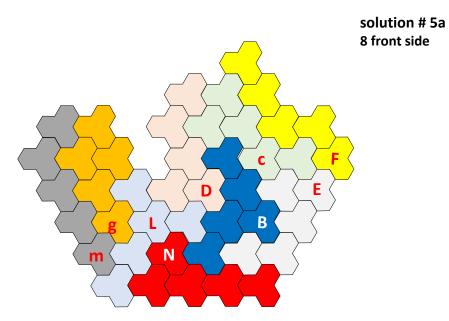

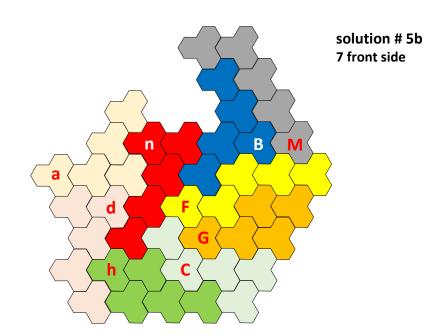

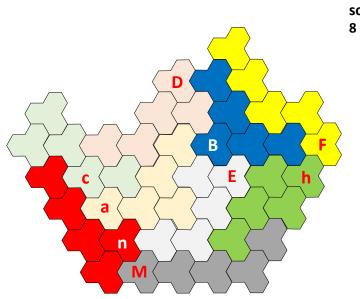

solution # 4 5 front side

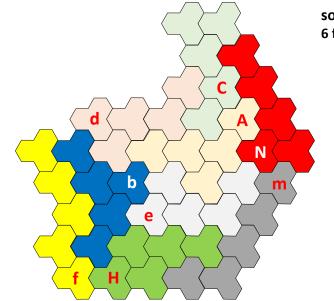

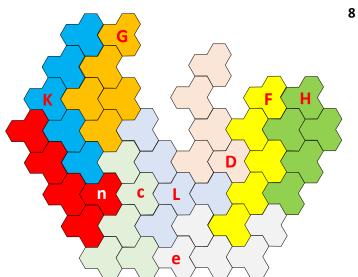

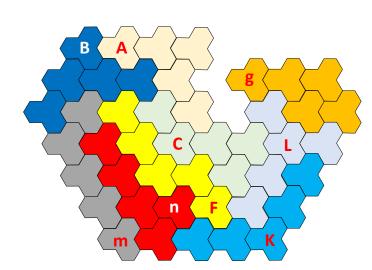

solution # 6a 8 front side

solution # 6b 6 front side

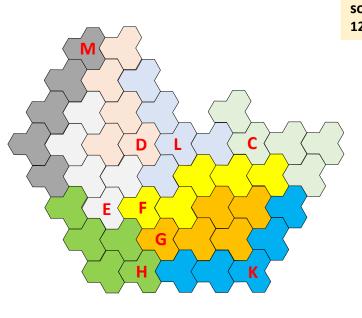

solution # 7a 8 front side

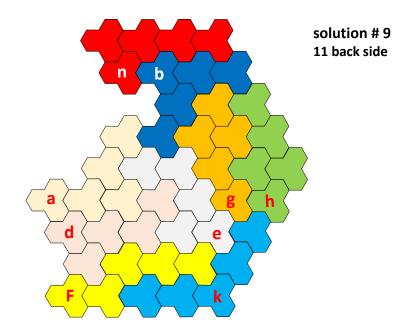

solution # 7b 7 front side

solution # 8 12 front side

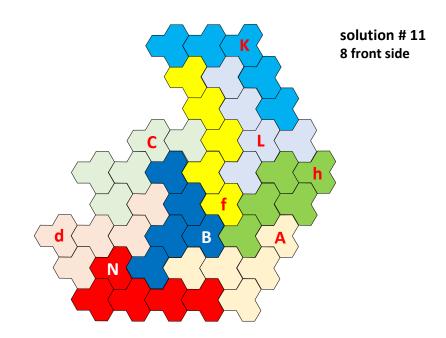

solution # 10a 8 front side

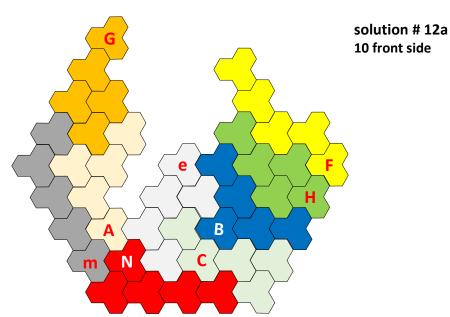

m

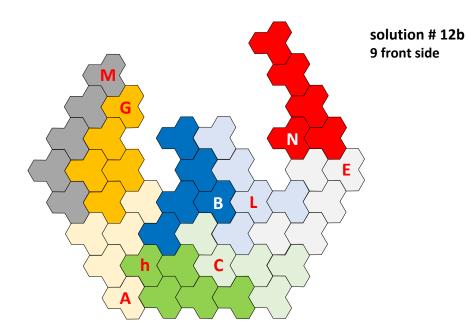

solution # 10b 8 front side

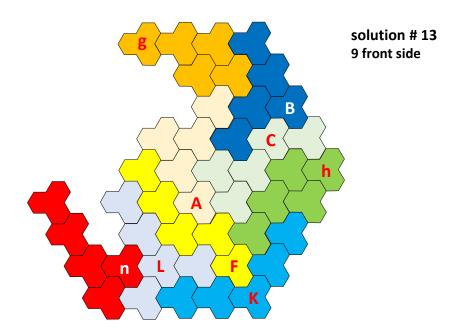

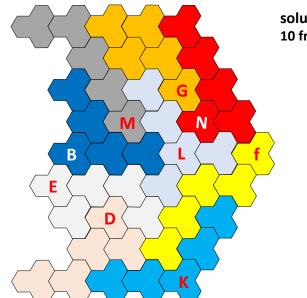

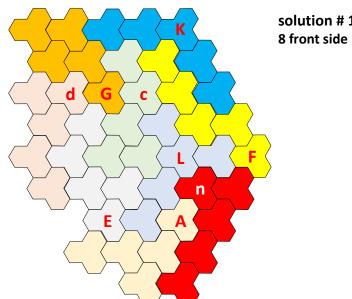

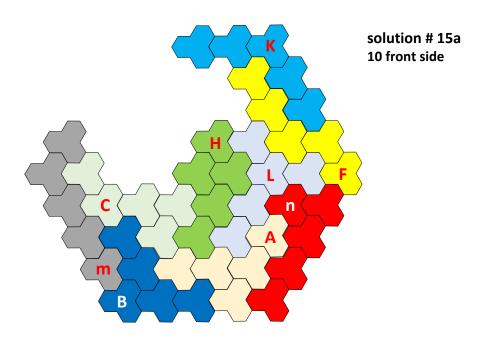

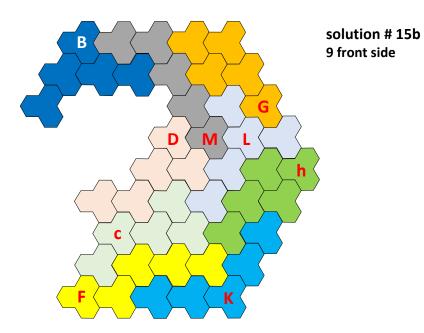

solution # 14a 10 front side

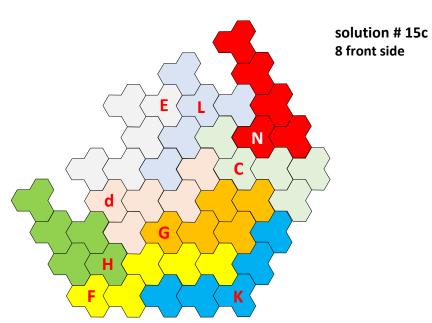

solution # 14b

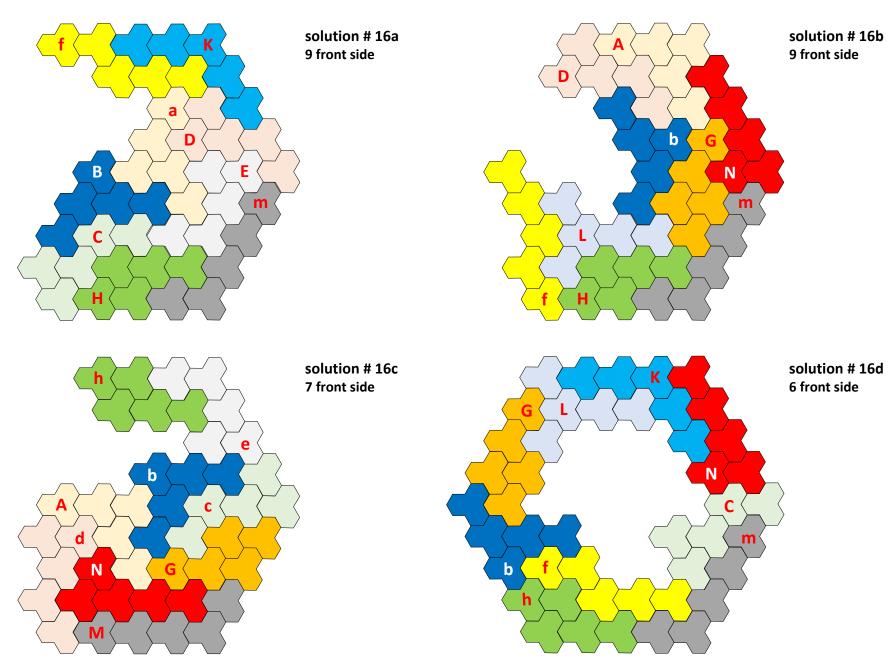

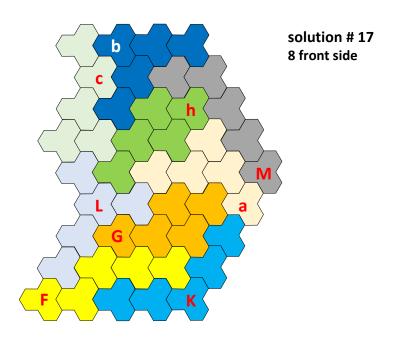

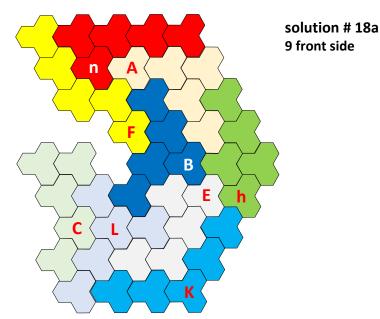

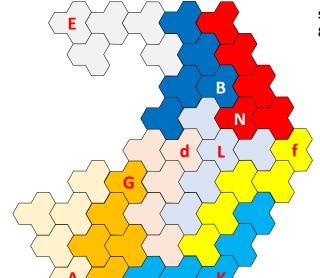

solution # 18b 8 front side
